#### Setting goals made fun!

# TASKIO

By
Shelby El-rassi
&
Alexander Qiang

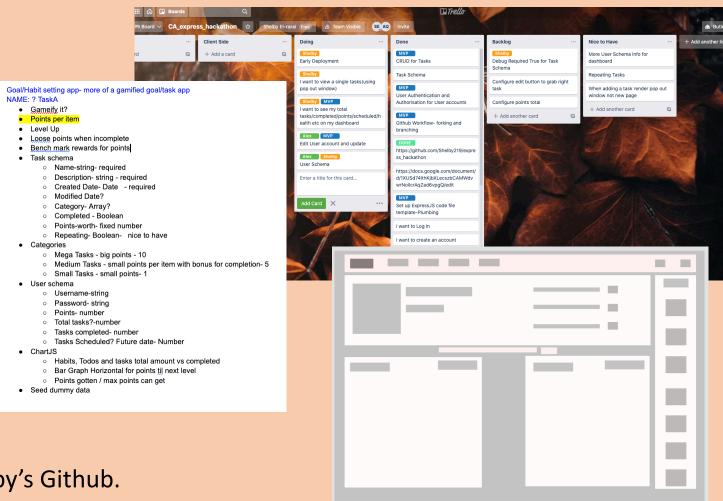

# Purpose 🦴

- The app is made to simplify our daily tasks schedule and build good habits.
- A gamified version just adds a modern-day fun spin on a standard task tracker.
- We at Taskio believe in the power of setting good goals and pushing ourselves forward.

- Trello for planning
- Google notes with initial ideas.
- Basic Wireframe
- Git Workflow
  - Main Repository, created on Shelby's Github.
  - Alex forked from the created repo.
  - We both used branches for current features/work we were working on.
  - Then once happy with the branch, we pulled latest from main.
  - Then made a pull request to merge with main.
  - Workflow was smooth and merge conflicts were resolved with ease.

### Technology

- JavaScript
- MongoDb
- Express JS
- Node JS
- Mongoose
- Pug JS
- Chart JS
- HTML
- CSS
- Postman
- Trello
- Google Docs
- Figma

- Heroku
- Font Awesome
- Node Packages
  - Express
  - Cors
  - Mongoose
  - Passport
  - Passport-remember-me
  - Express-session
  - Connect-Mongo
  - Method-override
  - Node-fetch
  - Path

### Features 💙

#### CURRENT

- User can Register and Login (and remember user)
- User can add their name and avatar through edit user
- View User Dashboard (authenticated)
- Add new tasks, edit and delete
- Mark Tasks as Completed which accumulates points.
- View Total Points on Dashboard.
- View total and completed task tally on nav bar.

#### FUTURE

- Health and Ability Earnings via the ChartJS.
- Implement Reward Shopping (the pixel) art)
- Advance Task functions, future dating, repeating, category sorting.
- Advanced User account details.
- Profile image upload file. (not string) URL).
- Oauth with account access.
- Show total tasks that are getting close to due date(the timer in the nav bar).
- Search task function.

## Specific Challenges 😤

- Setting up a remember me with passport-remember-me.
- Processing a delete route, via an event listener on button then fetch call.
- PUT route for updating task. Utilized NPM method override via pug form.
   Can override a POST method to become PUT.
- Handlebars EW, so pug JS was used for rendering. Integrating client side with PUG rendering.
- Updating task and user was wiping data all the data.
- Not going overboard with too many features we wanted in the short time.

### THANK YOU
